2015/03/10

# General conclusions (5)

---

- **The meaning of 1 % to decrease GHGEA (Greenhouse gas emissions from agriculture) in 2030 as compared to the level of 2012:**
  - Decline in agriculture output by ~ 10,5 MEUR
  - Decrease of value added in agriculture by ~ 2,5 MEUR;
  - **Additional decrease in agriculture employment by ~ 0,6 thsd AWU;**
  - Decrease of UAA for production by ~ 12 thsd. Ha
  - 1 % point of GHGEA from 2005 level equals to ~325 KEUR “GHG additional tax”, when CO<sub>2</sub> market price is 15 EUR/t

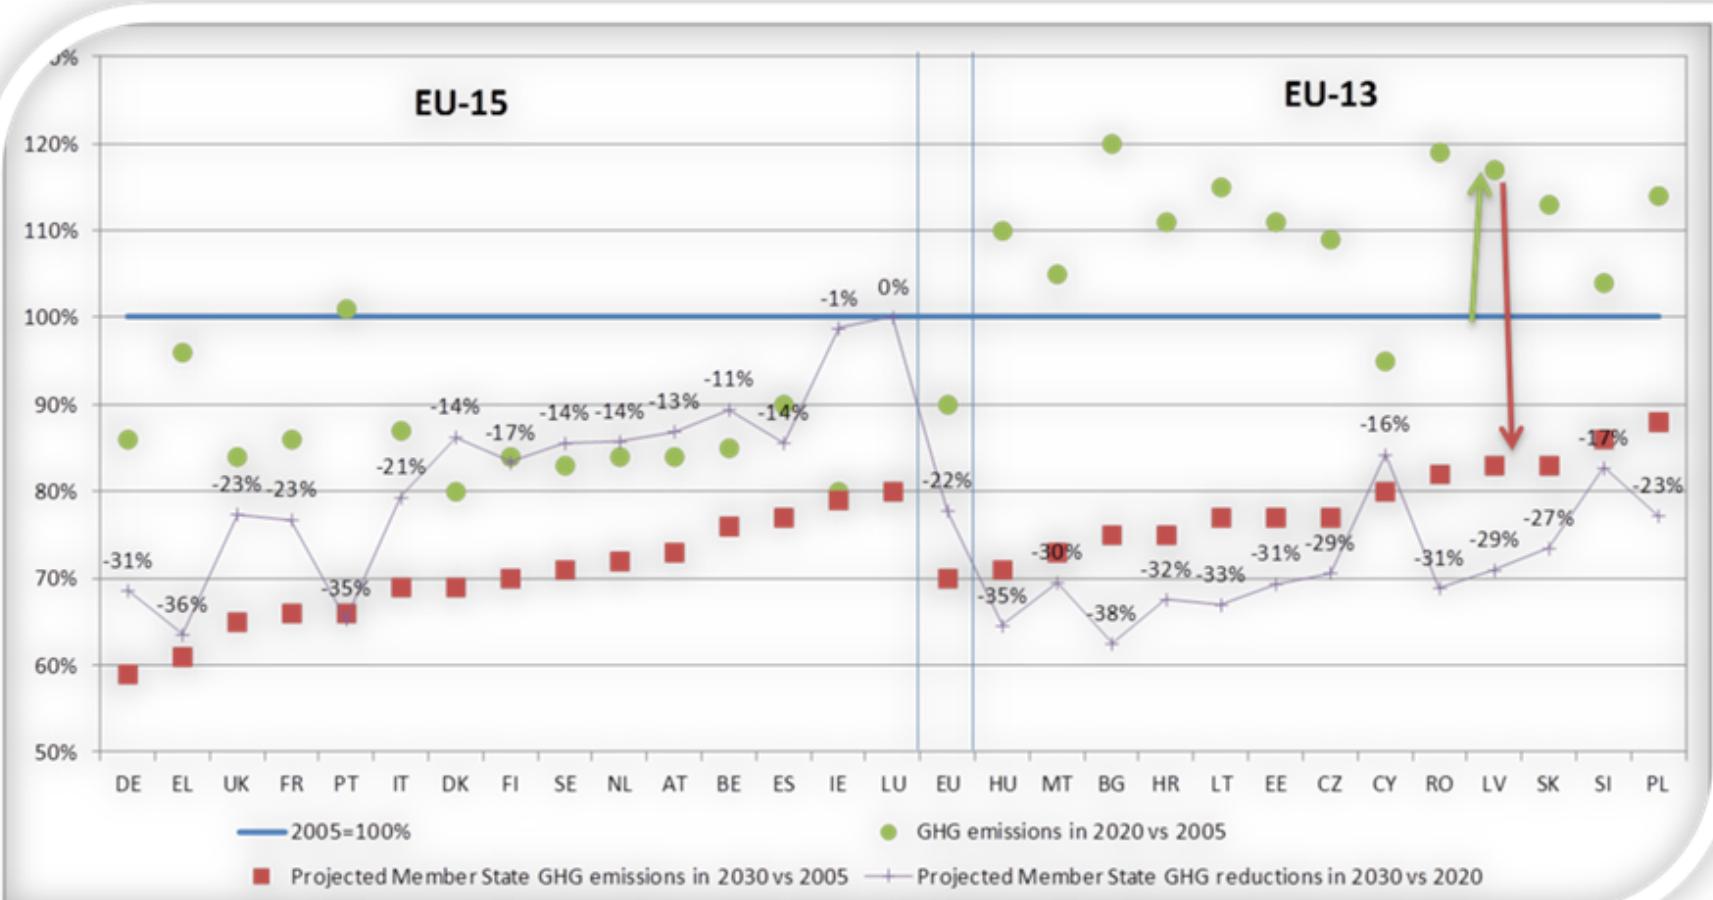

# Evaluation

---

- Done
  - August – October 2014
- Based on assumption
  - 40% target for GHG: total GHGE should be decreased by 40% (compared to 1990):
    - By 30% (as compared to the level of 2005) from non ETS sectors
  - Agriculture is a step in an intermediate agri-food production chain, where the up- and down stream sectors are the rest ones

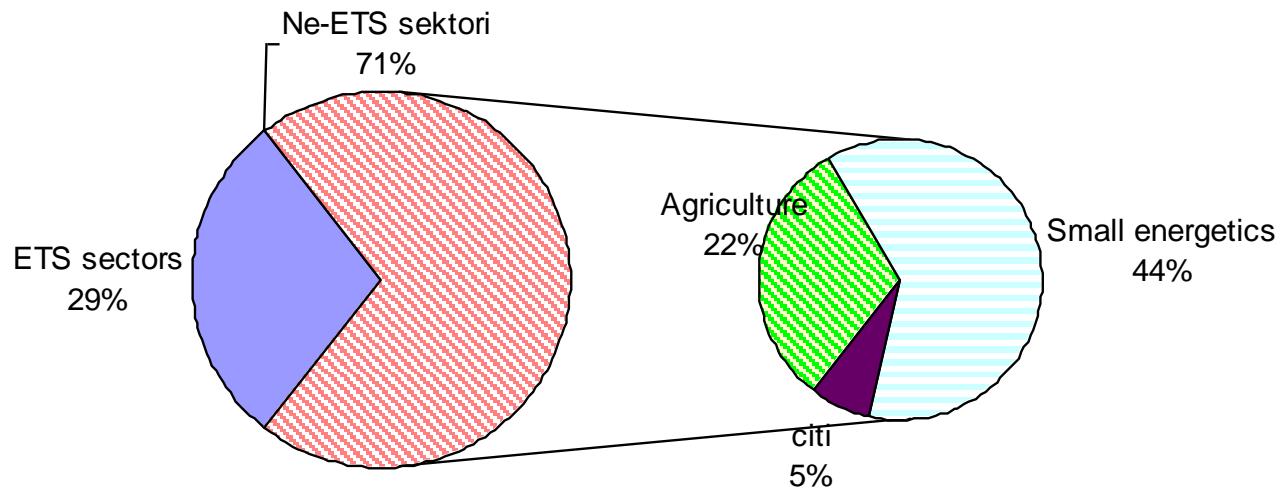

# The 2020 and 2030 Targets for non-ETS sectors as compares to the level of 2005 and to the 2020 target

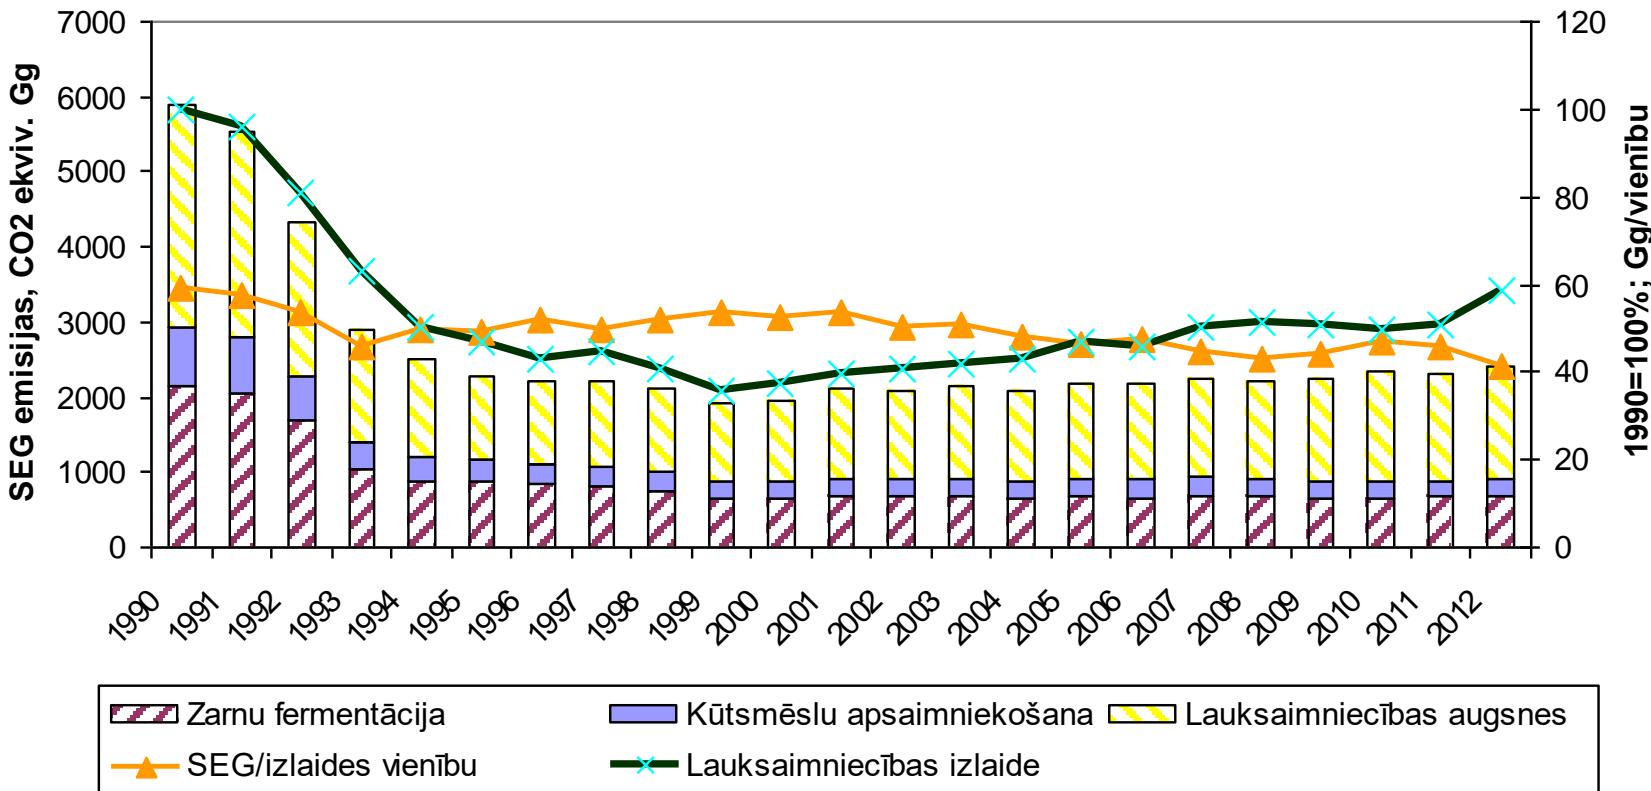

Source: Jānis Reķis, FEI

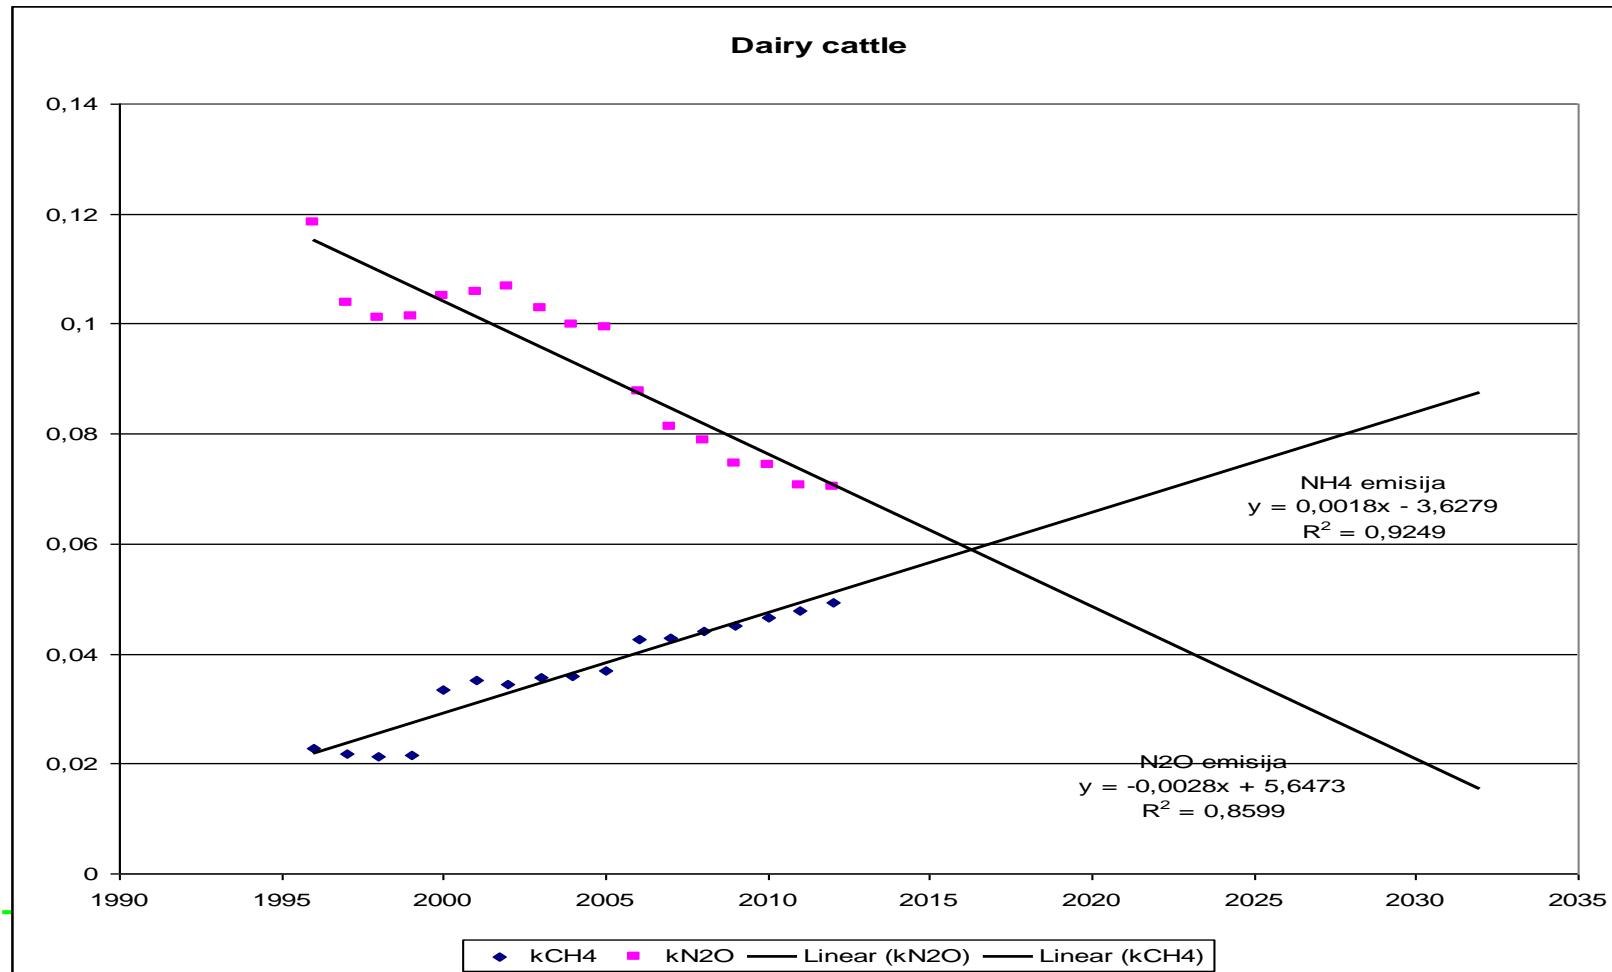

# The share of agriculture in the total volume of GHGE in Latvia in 2012

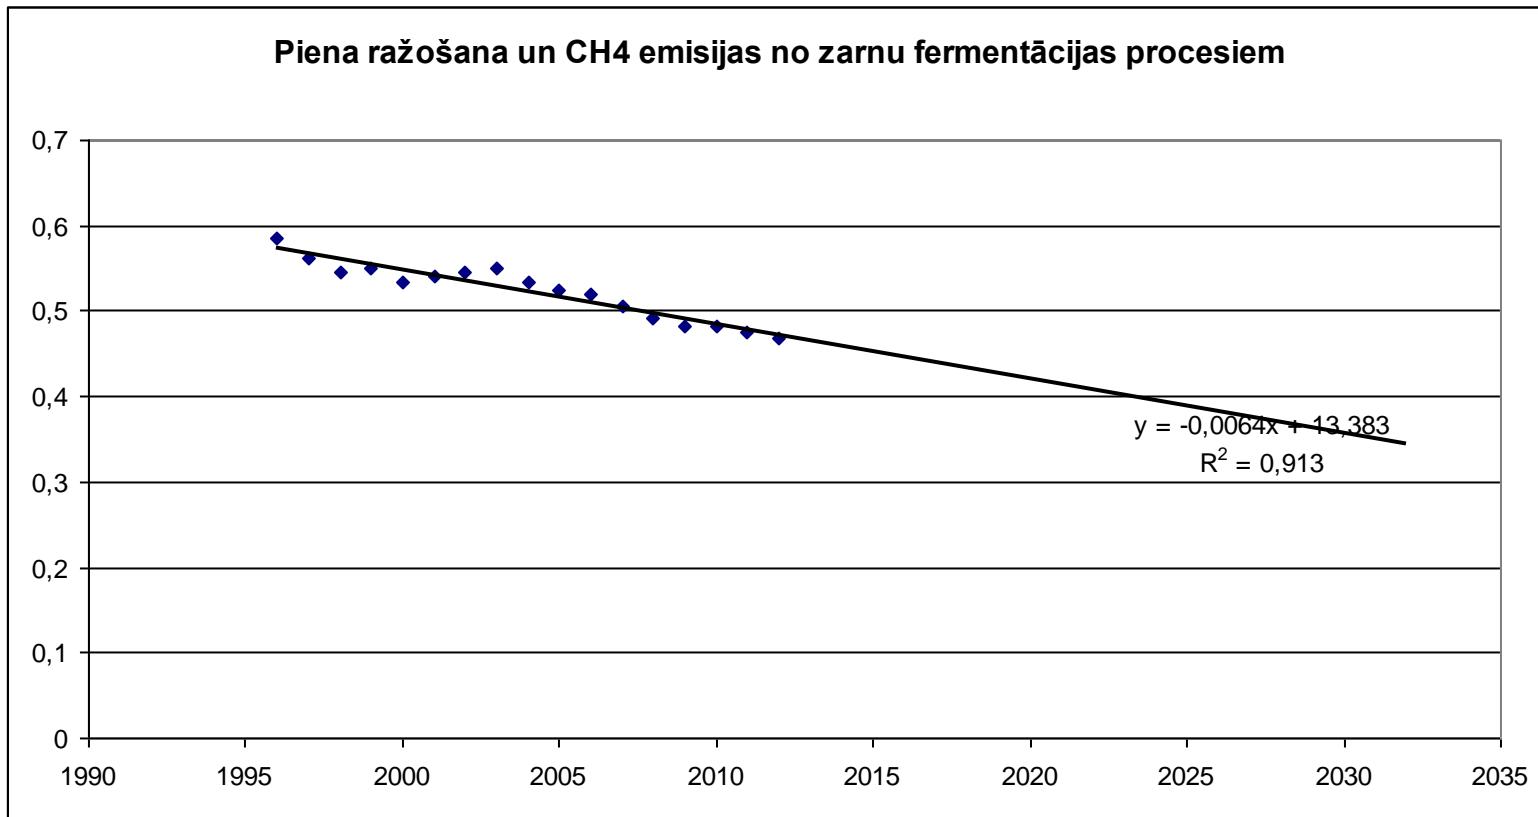

# GAO (1990=100%) un GHG emissions (thsd. t CO<sub>2</sub>) froom agriculture: 1990-2012

# Milk production and GHGEA from manure management: 1995- 2012

# Milk production and CH<sub>4</sub> emissions from enteric fermentation: 1995-2012

# National ag-policy background

---

- Latvia has defined an agpolicy goal – to come back with agricultural production on 1,9-2,0 Mha in 2020 (as compared to ~ 1,3 Mha in 2012)
  - GAO might increase at least by 80% in 2030, as compared to 2012
  - Additional GHGE will be produced in agriculture inevitably
    - ~ 130 % from the GHGEA level of 2012 might be reached in 2020 (~144% from 2005)
    - ~ 190 % from the GHGEA level of 2012 might be reached in 2030 (~212% from 2005).

# Evaluation approach

---

- 2030 GHGE forecasts from 2013
  - Agriculture output –
    - Total
    - By sectors
  - GHGE rates by agricultural sectors
- Agriculture output
- Agriculture value added
- Productivity in Agriculture and employment
- Up- and down- stream industries
  - Productivity and employment

# Scenarios

---

- BASE
    - Forecasts, reported to EC in (AO and GHGE)
  - III Scen
    - 2020 = GHGEA +17% from 2005
    - 2030 = 2020
  - II Scen
    - 2030 = GHGAE - 4% from 2005
  - I Scen
    - 2030 = GHGEA -10% from 2005
- 

# GHGEAE limits for different scenarios, Gg CO<sub>2</sub> per year

Employed in Agrifood	Thsd	86,1	40,9	33,8	38,9	22,8	18,1	19,2	14,8
Decrease of employment, compared to Base Scenario	Thsd	%		7,1	17%	16,1	20,8	19,8	24,1

# Some conclusions

---

- **The meaning of 1 % to decrease GHGEA (Greenhouse gas emissions from agriculture) in 2030 as compared to the level of 2012:**
  - Decline in agriculture output by ~ 10,5 MEUR
  - Decrease of value added in agriculture by ~ 2,5 MEUR;
  - **Additional decrease in agriculture employment by ~ 0,6 thsd AWU;**
  - Decrease of UAA for production by ~ 12 thsd. Ha
  - 1 % point of GHGEA from 2005 level equals to ~325 KEUR “GHG additional tax”, when CO<sub>2</sub> market price is 15 EUR/t

# Some conclusions (2)

---

- Decrease of GHGEA limits by 10% (from the 2005 level) will lead:
    - Low level (36 %) of the use of Latvia's potential to produce agricultural production (source for food production)
    - Lost of ~ 600 MEUR VA in total agrifood sector
    - Lost of ~ 11 thsd. (53%) of **employment potential agriculture**
    - Lost of ~ 21 thsd. of **employment potential in agrifood sector**
- 

**Is it a “right price”  
to pay for...?**
